

SEMIPRIME BIRING

W.B. Vasantha Kandasamy and Y.I. Showriraju

In this paper we define a new type of birings that are semiprime. We prove if a biring has no common ideals and if both the rings of the biring are semiprime then the biring is semiprime. Further if K is a bifield of characteristic zero then the group biring KG is semiprime where G is any group. Several other interesting results about group birings are proved.
