In this dissertation we have used Bidirectional Associative Memories (BAM) model to study the stress strain relationship between parents and children studying in primary school. We obtained interviews using linguistic questionnaire of parents teachers and children. Using this data we converted into BAM model. From our study we mainly derived the following

1. The child suffers all types of psychological problems arising out of language barrier. The study suggest the free expression is mainly lost due to the language for they use English as the language of communication but no Indian home living in India can have English as their language at home.
2. Parents due to the strain of earning more fail to spend time with the child even after school hours.

The fees burden plays a least role when the parents try to put their wards in an school of high repute.
